

Brainstorming for Revolt 86

What if?

- What if there is a card where its game rules wouldn't translate into code?
- What if using the Smart Board delays and slows down the gameplay?
- What if connecting the Healthbar Interface needs its own microcomputer instead of being able to connect to the main micro computer inside the board?
- What if the blue tooth dice cannot connect to the display and the board?
- What if there is a better way to implement a card reader into the board?
- What if I'll need to fabricate a digital artifice tracker instead of having it in the display itself?
- What if doing the digital artwork for the card itself requires more skill than I have?

Rapid Ideation

- A mobile game where you wouldn't need to purchase the physical board.
- A separate non-digital version of Revolt 86 where the game logic is kept track by the players.
- A multiplayer ranking system that's kept track by creating an account and linking it to your phone.
- A board that connects to the Wifi and by connecting your phone to the same wifi It can connect to the board via the same network.
- A ready to use expansion pack that is bought online or in stores, containing new cards, new traps, or new pieces.

Yes, And...

- Yes, and what if when a new card releases the board updates so every player can use this new card on the smart board.
- Yes, and we give the player options to customize their Healthbar Interface.
- Yes, and the smart board can detect when a player lifts a piece using electrical signals.
- Yes, and the board can track the health of each piece for you.
- Yes, and the board lights up the direction you can move and shoot in.
- Yes, and the board keeps track of how many traps there are on the board.
- Yes, and what if the board changes based on what card is played.
- Yes, and what if the board display gives you warnings on what you can and can't do based on the rules of Revolt 86.

Forced Juxtaposition

Random Word:

Frame - The board will have a strong magnetic frame where it will be able to secure the game pieces to the board.

Core - At its core the mechanics of this game produces a vast amount of outcomes and moves.

Plan - Players must plan before, during, and after each move as their pieces could get countered, destroyed, or sabotaged.

Kill Your Idea

- This would break if you can't securely create an app where it keeps players' information safe.
- This depends on every electronic component that is a part of the board being able to communicate and relay the correct information.
- This fails unless the game instructions remain clear for the player's
- This would break if the microcomputer runs out of storage.
- This fails unless we can prove that the board can read each piece.
- This fails unless the RFID reader and sticker can be implemented into the board.
- This fails unless the card readers, displays, and bluetooth dice can connect to the main microcomputer.

What if not?

- What if Revolt 86 didn't have any cards and it was just focused on moves rather than abilities?
- What if players can't understand the instructions?
- What if players aren't motivated to take down enemy pieces?
- What if you could place more than one card down?
- What if you could split up the die roll into different pieces without using a special card.

Role-Shift Brainstorming

From the Perspective of a First Time Participant

- First time players will encounter their first hurdles as they get used to the base rules of Revolt 86. Artifice Trackers are external tile trackers used to place traps. They will have a hard time keeping track of these Artifice Trackers throughout the game. Knowing when to place each of the three different types of cards throughout their turn is also a learning curve without the smart board and hopefully could be coded into the smart board display. Players assume that the smart board will carry most of the responsibility of the player during each turn. But without the basic understanding of the rules, new players will struggle to keep up as the smart board is only one part of the immersive experience that bridges this board game to our world.

Extreme Constraint

- What remains when most resources are removed?

With most of the resources removed (Displays, Bluetooth die, Card Readers, LED Board, RFID Stickers.), what remains is a tightly designed board game that has a high fidelity 3D printed board and pieces with printed trading cards and an overall polished experience.

- What absolutely cannot be cut?

The board itself cannot be cut, it has to be a well designed board with a grid of 8 x 12. As well as game pieces and cards.

- What does the project become at its smallest possible scale?

At its smallest possible scale it becomes only a concept and a low fidelity makeshift board game.
