

Deliverable

There are a lot of recurring questions related to the computing part of the project. The biggest question was if it was even possible for every component to communicate with the microcomputer inside the physical board. There is a real strong interest on the design side of the game such as the board, art work for cards, and the design for the game's physical pieces. There is an assumption that all of the cards and mechanics of the game can be translated into code for the board to understand. Need more research on the hardware needed as well as the code needed to create the game logic. I am very surprised that even without a smart board, this game can hold up its own and it will be the start of what could be a bridge between the digital and physical mechanics that will potentially create future smart board games.
