

Inspirational Research

Chess comes to mind as a huge inspiration for the layout of my board and pieces as they are both set up very similarly, explicitly noting a strong resemblance in the position of each piece on their respective board. Although the board for Revolt 86 is a different grid and its pieces have different moves, both of these games are turn-based. I truly enjoy the simplicity of chess and its vast amount of outcomes created by its game mechanics. This creates an environment for competition and exciting strategic plays. My game will take this environment and multiply its outcomes as new game mechanics are being used. The goal is to have each player come up with the best possible move from whatever ability and dice roll they're given at random. I want a game that keeps you on the edge of your seat. I want players to find moves and different ways to keep their lead or gain the upper hand. I took inspiration from a chessboard layout and since chess already has a distinct game experience I will not be translating anything else to my project.

Another inspiration is a smart chess board, only for its hardware and the proof of concept that my smart board can be created. It gives me a starting point from where to start and what it would take to market it. I would like to put my game out there for other people to enjoy.

As for the robot mechs and crazy futuristic war machines, the inspiration came from a first person shooter called Titanfall 2. This was a game where you could ride a variety of different mechs with different abilities. I really enjoyed the combat between players, a fast pace combat using a variety of abilities and firearms. So I wanted a way to implement a similar combat style to fit a physical board with a grid. I loved Titanfall 2's sci-fi storytelling and its environment so I created my own war-ridden future.
